# GUIDE

*This is a guide to play games that cannot be run on computers with game filters.*

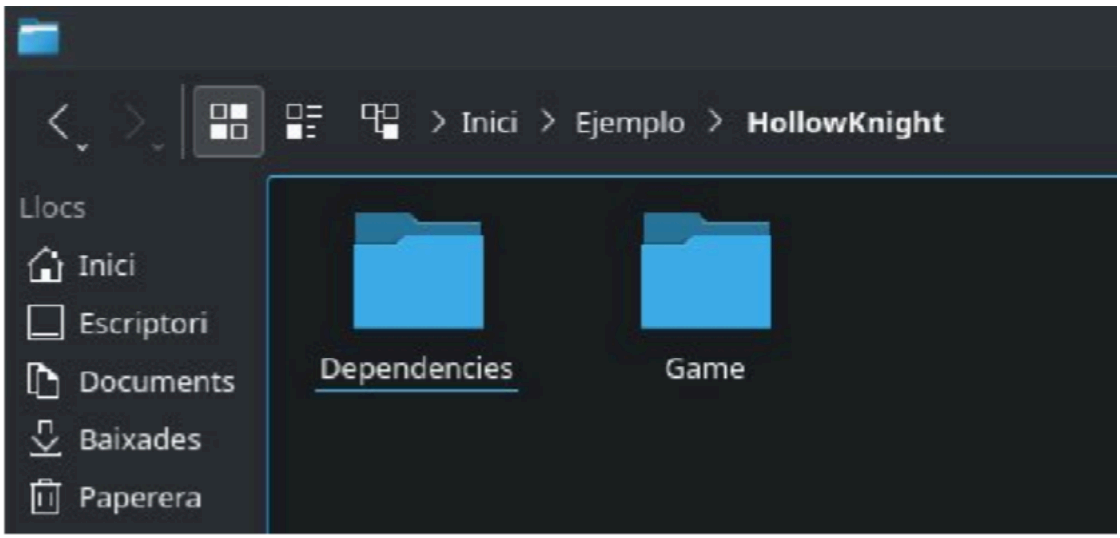

1. Download the game file and the wine file in order to run the game.

2. Extract both files into a folder created by yourself.

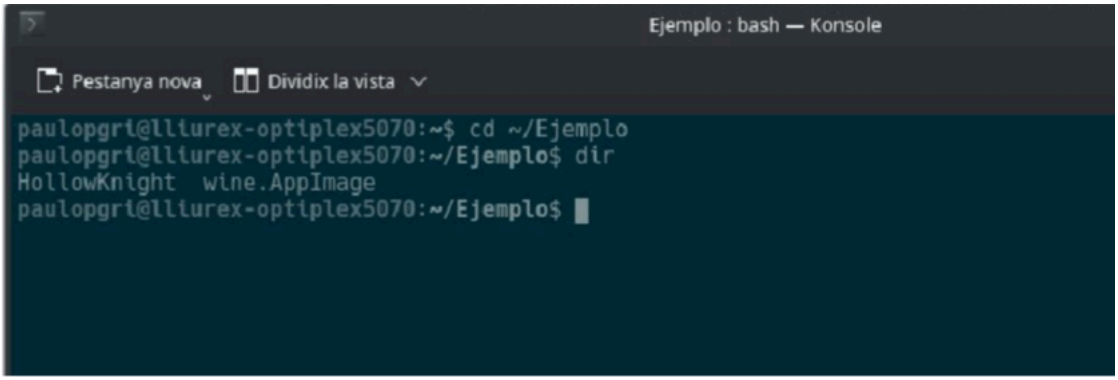

3. First of all, check that the .exe and .sh files have execution permissions (right-click -> properties -> Permissions -> check the box so it can be executed). If the game has a .sh executable, you can try running it directly; if it doesn't work, download the .exe file.

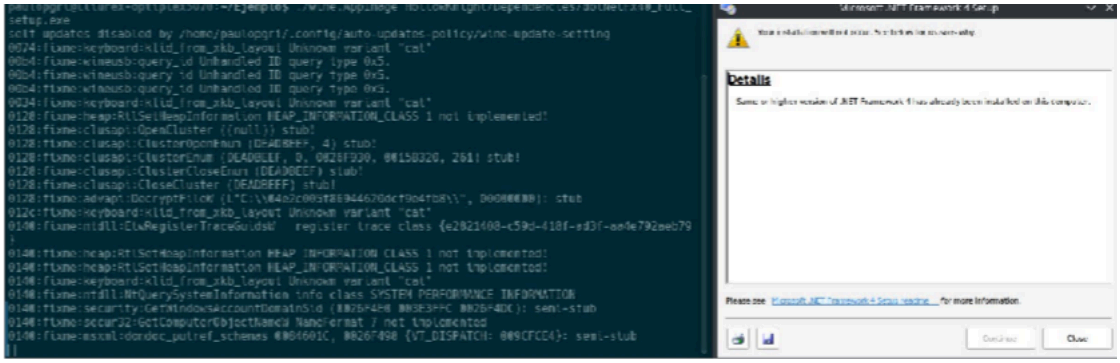

4. The game may require other dependencies, which you can check inside the game folder where there will likely be a folder named "Dependencies" or "Common_Redist".

5. For the dependencies, open the terminal (cmd) and navigate to the folder repository where you have the two files.

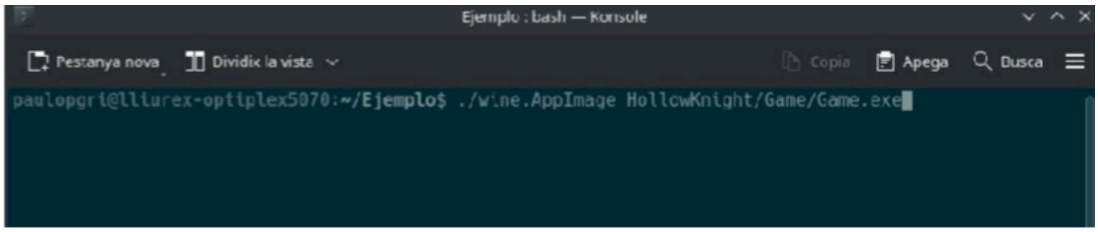

6. Next, enter this command along with the dependency you need to download, and do the same for all dependencies.If the command does not work, enclose the dependency path in double quotes.

- Type "./" followed by the name of the wine file, and then the path to the .exe file you want to run. In this case, it tells me that a version is already installed because I had it previously. After that, do the same with the other dependencies.

7. Once they are installed, do the same but with the .exe of the game.If the command does not work, enclose the command path in double quotes.

**Some issues:**

> If a notification pops up asking for permission to execute any file, select yes.
